

COLORANT & COATING

R&D Facility

Lamb provided Planning and Design Services to construct a new coating facility for a major supplier of products to the food and pharmaceutical industries.

The new 20,000 S.F. facility is used for research and development, and testing purposes. Comprised of numerous individual coating suites and laboratories, the project required the renovation of the existing warehouse and relocation of several existing coating pans. The facility was designed to meet cGMP requirements including a new air handling system, DI water, dust collection, compressed air, and cleanable finishes.
